Appendix 2: Selected Publications Using Ratings from Economic Freedom of the World

The following are some of the articles that have used the economic freedom ratings from Economic Freedom of the World. In most cases, a brief abstract of the article is provided. Those interested in doing further research using the Economic Freedom index are invited to retrieve the data set from the website of the Economic Freedom Network, <http://www.freetheworld.com>. The most up-to-date information on articles using the index of Economic Freedom of the World can be found at <http://www.freetheworld.com/papers.html>.

The authors conclude that increases in economic freedom are associated with improved economic performance in that increases in economic freedom move countries closer to the production frontier.

“This paper takes advantage of newly constructed measures of economic freedom to show the importance of economic freedom on growth. I find that economic freedom is a more robust determinant of growth than political freedom and civil liberty.” Uses summary ratings from Economic Freedom of the World: 1975–1995 as one variable in a comparison of a number of institutional variables.

“Until very recently most of the studies investigating the determinants of growth fail to incorporate the importance of institutions into their empirical analysis. This paper highlights the importance of institutions on growth and development, and evaluates the empirical results on the effect of institutions on growth and investment. It provides ample evidence that the institutional environment in which an economic activity takes place is an important determinant of economic growth. This paper uses alternative measures of institutional quality to capture the role of institutions in explaining growth differences across countries. When these institutional variables are incorporated into the core regression equations as additional explanatory variables in two different sample periods; both samples yield similar results. The empirical results reveal that countries with high levels of economic growth are characterized by high levels of economic freedom and judicial efficiency; low levels of corruption, effective bureaucracy and protected private property.” Summary ratings from Economic Freedom of the World: 1975–1995 provide a key institutional variable.

This paper examines the robustness of economic freedom as a predictor of growth and investment compared to political rights and civil liberties. It also examines the relation between economic freedom and input-price distortions and institutional quality. Uses summary ratings from Economic Freedom of the World: 1975–1995 as one of a number of institutional variables.

In this paper, the authors looked at what factors determine the level of corruption across nations. They used education, judicial efficiency, the size of government, political and economic freedom, foreign aid, ethnicity, and the type of the political regime to explain cross-country differences in corruption. They concluded that “corruption is found to be negatively and significantly correlated with the level of education, judicial efficiency, and economic freedom. It is positively and significantly correlated with foreign aid and the size of government” (p. 461).

The paper uses regression analysis to examine the effect of the components of economic freedom on growth, output and investment and finds that “economic freedom enhances growth both via increasing total factor productivity and via enhancing capital accumulation.” It also identifies components that have the highest statistical effects on these variables, with the aim of informing policy makers. Uses component ratings from *Economic Freedom of the World: 1975–1995* as main data source for institutional variables.

“This paper explores the interplay between economic freedom, foreign direct investment (FDI) and economic growth using panel data analysis for a sample of 18 Latin American countries for 1970–1999. We find that economic freedom in the host country is a positive determinant of FDI inflows. Our results also suggest that foreign direct investment is positively correlated with economic growth in the host countries. The host country requires, however, adequate human capital, economic stability and liberalized markets to benefit from long-term capital flows.” Uses summary ratings from *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

This paper describes a theoretical model of the relationship between economic freedom and income distribution, and investigates empirical results. The results indicate that “sustained and gradual increases in economic freedom influence equality measures positively … [but] the absolute level of economic freedom appears to be negatively related to equality in some cases.” Uses summary ratings from *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

“While studies of the relationship between economic freedom and economic growth have shown it to be positive, significant and robust, it has rightly been argued that different areas of economic freedom may have quite different effects on growth. Along that line, Carlsson and Lundström (2002) present the surprising result that “International exchange: Freedom to trade with foreigners” is detrimental for growth. We find that “Taxes on international trade” seems to drive this result. However, using newer data and a more extensive sensitivity analysis, we find that it is not robust. Least Trimmed Squares-based estimation in fact renders the coefficient positive.” Uses Economic Freedom of the World index as the main data source for institutional variables.

“We present new evidence on how generalized trust is formed. Unlike previous studies, we look at the explanatory power of economic institutions, use newer data, incorporate more countries, and use instrumental variables
in an attempt to handle the causality problem. A central result is that legal structure and security of property rights (area 2 of the Economic Freedom Index) increase trust. The idea is that a market economy, building on voluntary transactions and interactions with both friends and strangers within the predictability provided by the rule of law, entails both incentives and mechanisms for trust to emerge between people.”

“We analyse the effect of IMF and World Bank policies on the composite index of economic freedom by Gwartney et al. (2000) as well as its sub-indexes, using a panel of 85 countries observed between 1970 and 1997. With respect to the Bank, we find that the number of projects has a positive impact on overall economic freedom, while the effect of the amount of World Bank credits appears to be negative. These effects are stronger during the 1990s than in earlier periods. There is no clear relationship between credits and programmes of the IMF and economic freedom as measured by the index.” Uses summary ratings from *Economic Freedom of the World: 2002 Annual Report* as the main data source for institutional variables.

“Most studies of the relation between economic freedom and growth of GDP have found a positive relation. In this paper we investigate what specific types of economic freedom measures that are important for growth. The results show that economic freedom does matter for growth. This does not mean that increasing economic freedom, defined in general terms, is good for economic growth since some of the categories in the index are insignificant and some of the significant variables have negative effects.” Uses summary ratings and the components from *Economic Freedom of the World: 2002 Annual Report* as the main data source for institutional variables.

“The purpose of this study is not to compare different theories of economic growth, but to evaluate the impact of economic freedom on economic growth under alternative theoretical frameworks. The particular measure of economic freedom employed—the EFW index—was found to be quite robust and with respect to major changes in the model specifications. We conclude that economic freedom is significant factor in economic growth, regardless of the basic theoretical framework.” Uses *Economic Freedom of the World: 2002 Annual Report* as the main data source for institutional variables.

“This paper outlines the alternative channels through which institutions affect growth, and studies the empirical relationship between institutions, investment, and growth. The empirical results indicate that (i) free-market institutions have a positive effect on growth; (ii) economic freedom affects growth through both a direct effect on total factor productivity and an indirect effect on investment; (iii) political and civil liberties may stimulate investment; (iv) an important interaction exists between freedom and human capital investment; (v) Milton Friedman’s conjectures on the relation between political and economic freedom are correct; (vi) promoting economic freedom is an effective policy toward facilitating growth and other types of freedom.” Uses *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

“It is often maintained that economic freedom underlies high levels of economic growth. This paper compares various indicators for economic freedom. We conclude that, although these measures differ somewhat in their coverage, they show similar rankings for the countries covered. Some elements in these measures are, however, questionable. Our main conclusion is that greater economic freedom fosters economic growth. The level of economic freedom is, however, not related to growth.” ♦ Uses summary ratings from *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

“This paper examines the relationship between economic and political freedom, focusing on developing countries. We conclude that increases in economic freedom between 1975 and 1990 are to some extent caused by the level of political freedom. This result shows up for all measures of political freedom that we employ.” ♦ Uses summary ratings from *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

“Using time-series cross-section analysis, we provide additional empirical validation for the principal-agent model developed by Adserà et al. (2003). In our innovation, efficient economic policy is proxied by “economic freedom” from the Fraser Institute database and constitutional ‘political institutions’ are proxied by variables from the Database of Political Institutions. Our results suggest that the more credible the threat of removal from office, the more government officials will pursue efficient economic policies.”

The study analyzes the literature on the impact of economic freedom on economic growth. The authors analyzed the results of 45 different studies published over the last decade and concluded that “regardless of the sample of countries, the measure of economic freedom and the level of aggregation, there is a solid finding of a direct positive association between economic freedom and growth” (p. 19). Furthermore, they noted that studies of economic growth that fail to include a measure of economic freedom in their analysis will produce biased results. The authors also highlight the importance of including a measure of physical investment when estimating the impact of economic freedom on economic growth. They found that the exclusion of a measure of investment in physical capital increases the estimated effect economic freedom has on economic growth.

“We analyze the impact of International Monetary Fund (IMF) programs on market-oriented reforms [as measured by economic freedom]. Employing panel data for 116 countries over the period 1970–2000 we find that the net effect of IMF programs on reforms is negative.”

This paper finds that economic freedom is an important explanatory variable for steady-state levels of income. The addition of a variable for economic freedom is also shown to increase the explanatory power of a neo-classical growth model. ♦ *Economic Freedom of the World: 1975–1995* is the main data source for institutional variables.

“Previous empirical research on the social and economic impact of freedom has tended to focus on the link between freedom and economic growth rates. Only a few studies have looked at freedom’s effect on the quality of life, and these generally focused on the effect of political freedom. Here, we attempt to bridge this gap by analyzing the effect of economic freedom on the quality of life. Taking advantage of newly developed measures of economic freedom, we analyze the impact of economic freedom on life expectancy and literacy rates. We find that greater economic freedom enhances the quality of life both across nations and increases the improvements in the quality of life over time.”

The paper uses Granger causality analysis to demonstrate that economic freedom “causes” economic well-being and economic well-being “causes” economic freedom. Additionally, the authors argue that economic well-being causes political freedom but that there is no causation flowing from political freedom to economic well-being. The paper also finds no evidence of a causal relationship in either direction between economic freedom and political freedom. Indirectly economic freedom causes political freedom through its effect on economic well-being. 

“This paper investigates the impact of various components of economic freedom on corruption. Some aspects of economic freedom appear to deter corruption while others do not. We identify a stable pattern of aspects of economic freedom influencing corruption that differs depending on whether countries are rich or poor. This implies that there is a strong relation between economic freedom and corruption. This relation depends on a country’s level of development. Contrary to expectations, we find that some types of regulation reduce corruption.”

“Benhabib and Spiegel (1996) argue that human capital increases technological diffusion and, as a result, has a positive effect on economic growth. When human capital is accounted for in this way they find that other institutional variables do not affect growth. Their findings are re-examined by considering the effects of economic freedom on technology spillovers, hence on growth, and it is found that the greater the economic freedom in a country, the greater the amount of technological diffusion. More generally, this research suggests that institutional variables which are captured by economic freedom do indeed have an impact on growth, but only through technological diffusion. However, after accounting for the effects of economic freedom on technological diffusion, there is only weak evidence that human capital has a positive effect on technological diffusion.”

The paper compares economic freedom to income, growth, unemployment in the OECD, the UN Human Development Index, life expectancy, literacy, poverty, and income distribution. It finds that “economic freedom does not have a cost in terms of income levels, income growth, unemployment rates, and human development.”
This paper investigates the effects of institutions on economic growth through the impact of economic institutions on both the levels and productivity of investment. That is, the authors looked at both the indirect and direct effects of economic freedom on economic growth. They found, using data for 94 countries from 1980 to 2000, that countries that have high-quality institutions, as measured by The Fraser Institute’s report, *Economic Freedom of the World*, have not only higher levels of private investment, but also higher productivity with that investment. Specifically, it was found that the productivity of private investment, measured as the impact of investment on growth, was 74% greater in countries with high-quality institutions. In addition, the authors found that a one-unit increase in institutional quality, i.e., economic freedom, increases the long-term economic growth by about 1.5 percentage points when both direct and indirect effects are included, compared to 1.0 percentage point when only the direct affect of institutions are included.

This study examines the relationship between economic freedom and economic growth. The authors find that economic freedom is a “significant determinant of economic growth, even when human and physical capital, and demographics are taken into account.” The authors also test for causality. They find that increases in economic freedom lead to higher economic growth but not that higher economic growth leads to higher economic freedom. ♦ Uses summary ratings from *Economic Freedom of the World: 1997 Annual Report* as one of a number of institutional variables.

The paper discusses which cultural values are associated with economic freedom, drawing on two international quantitative cultural indexes. ♦ Uses the summary ratings from *Economic Freedom of the World: 1975–1995* as one of a number of institutional variables.

Market-oriented economic policies—reflected in limited economic activity by government, protection of private property rights, a sound monetary policy, outward orientation regarding trade and efficient tax and regulatory policy—have been strongly linked to faster rates of economic growth. Foreign aid is often provided in the belief that it encourages liberalizing reforms in these areas. This paper analyzes the impact of aid on market-liberalizing policy reform, correcting for the possible endogeneity of aid. Results indicate that higher aid slowed reform over the period from 1980 to 2000, as measured by a broad index of policies. Disaggregating policy into
five areas, aid is significantly linked to slower reform in some policy areas but not in others. Disaggregating by decade, aid’s adverse impact on policy reform is much more pronounced for the 1980s than for the 1990s. The Economic Freedom of the World: 2004 Annual Report as the key measure of market oriented policies.

“This article examines the historical records of poor economic performance of Latin America compared to East Asia’s relative success in the 1970s and 1980s. This study shows that the respective sociopolitical and institutional environment of the two regions was also an important factor contributing to their economic outcomes. Using data for selected countries in both regions, the results confirm the hypothesis of a negative direct (efficiency) effect of sociopolitical instability on growth, with an additional indirect (accumulation) effect through investment, irrespective of a country’s location. Policies adopted by governments, particularly to control inflation and foreign indebtedness and to enhance economic freedom and human capital accumulation, appear crucial for stability. Such policies influenced economic performance through both the direct and the indirect channels.” ● Uses summary ratings from *Economic Freedom of the World: 1975–1995* as the main data source for institutional variables.

“Recent finance scholarship finds that countries with legal systems based on the common law have more developed financial markets than civil-law countries. The present paper argues that finance is not the sole, or principal, channel through which legal origin affects growth. Instead, following Hayek, I focus on the common law’s association with limited government. I present evidence that common-law countries experienced faster economic growth than civil-law countries during the period 1960-92 and then present instrumental variables results that suggest that the common law produces faster growth through greater security of property and contract rights.” ● Uses some components of economic freedom from *Economic Freedom of the World: 1975–1995*.

Discusses the constitutional guarantees necessary to secure economic freedom and why such guarantees are important. Focuses on Africa. ● Makes reference to the general conclusions of *Economic Freedom of the World: 1975–1995* regarding economic freedom and income and growth.

Chapter 6, “A Balance Sheet of Structural Adjustment in Africa: Towards a Sustainable Development Agenda” (John Mukum Mbaku) and chapter 12, “Making the State Relevant to African Societies” (John Mukum Mbaku) emphasize the constitutional guarantee of economic freedoms as the single most important way both to generate the wealth that Africans need to meet the challenges of the new century and to deal more effectively with the continent’s colossal debt. ● Makes reference to the general conclusions of *Economic Freedom of the World: 1975–1995* regarding economic freedom and income and growth.

The study examines the effect of democracy on economic growth after controlling for a number of variables for the size of government and institutions and finds that it is not the redistributive policies of democratic governments that hinder development in developing countries but the lack of economic freedom. ● Uses the precursor to *Economic Freedom of the World*, “Measuring Economic Freedom,” by James Gwartney, Walter Block, and Robert Lawson, in Stephen Easton and Michael Walker (eds.), *Rating Global Economic Freedom* (The Fraser Institute, 1992). The summary ratings of “Measuring Economic Freedom” are used as one variable in a comparison of a number of variables for institutions and the size of government.

The paper compares property rights to indicators of development and determines that the “well-being of the world’s poorest inhabitants is sensitive to the cross-national specification of property rights.” The paper shows that well-specified property rights enhance the well-being of the world’s most impoverished. *Economic Freedom of the World: 1997 Annual Report* and the Heritage Foundation’s *Indices of Economic Freedom* are the main data source for institutional variables.

Investigates whether countries with better property rights have better performance on environmental measures. Uses the summary ratings of *Economic Freedom of the World: 1975–1995* as one of four measures used as proxies for property rights.

“Economic institutions are widely thought to be important in enhancing human well-being. Other scholars emphasize geography in determining economic deprivation and development. This paper examines both types of factors and finds that property rights and economic freedom substantially reduce poverty and enhance economic development.” Summary ratings from *Economic Freedom of the World: 2001 Annual Report* provides a key institutional variable.

This study examines whether economic policies and their outcomes have an effect on people’s self-perceived level of well-being. The authors used two different measures of well being, happiness and life satisfaction, both of which come from survey database managed by the Erasmus University in The Netherlands. Using data for 68 countries during the 1990s, Ovaska and Takashima found that economic freedom, as measured by The Fraser Institute, and health, as measured by life expectancy, have consistently turned out to be statistically significant in determining people’s level of well-being. That is, both longer life expectancy and the freedom to make choices that are consistent with personal preferences increases one’s self-perceived level of well being and happiness.

“The term ‘tigers’ refers to a group of four to five East Asian countries that joined the rich Western countries after less than 50 years of “miraculous” growth. Controversies surround the attempt to explain how the successes were achieved. This paper surveys the discussion and uses the index published in *Economic Freedom of the World* to address the main controversy, which is the role of the state in the rapid growth that took place. After a discussion of likely biases, the data are considered. Three of the five countries have a level of regulation much like other rich countries while two have been as close to *laissez faire* as any country in the world. All are much more “market-friendly” than the LDCs that they left behind. The extent of *laissez faire* can, however, be only one aspect of the miracle.”

The authors have compiled an index of intellectual property rights (IPRs), and examine its effects on growth and the factors of production (investment, schooling, and R&D). “The paper finds that IPRs affect economic growth indirectly by stimulating the accumulation of factor inputs like R&D and physical capital.” Uses summary ratings of *Economic Freedom of the World: 1975–1995* as a control variable for market institutions in the analysis.

“This study investigates the role that economic freedom plays in economic growth and in the distribution of market income, the role of government policy in advancing economic progress and in promoting income equality, and the effect that the rate of economic progress has on the distribution of market income. Structural and reduced form models are estimated that reveal that economic freedom promotes both economic growth and equity, and that there is a positive but relatively small trade-off between growth and income inequality.” ♦ Uses summary ratings and the components from Economic Freedom of the World: 1975–1995 as the main data source for institutional variables.

“The effects of de jure constitution enumerations and the number of de facto veto players in a polity on economic freedom are empirically explored with the result that only a few constitutional characteristics, such as a bicameral legislature, religious freedom and the de facto veto players, seem to matter.” ♦ Uses EFW index from Economic Freedom of the World: 2000 Annual Report as the dependent variable. This is a cross-section analysis covering 97 countries.

“Many empirical studies indicate that economic freedom in society is positively correlated with prosperity and growth, while democracy exhibits mixed correlations. However, these studies do not control for the possible interaction of these two types of freedoms or their respective influences on social welfare. This empirical analysis examines the interaction of economic freedom and democracy on measures of health, education, and disease prevention in society. The results imply that greater economic freedom consistently enhances these welfare measures, even among more democratic countries. Democracy has a smaller positive influence that disappears for many welfare measures in countries with more economic freedoms.”

“Using various indicators for economic freedom, it is shown that increases in economic freedom are robustly related to economic growth. This conclusion holds even if the impact of outlying observations is taken into account. The level of economic freedom is not related to growth.” ♦ Uses summary ratings from Economic Freedom of the World: 1975–1995 as the main data source for institutional variables.

This paper examines the impact of economic freedom on the reduction of conflict. The author concluded that “[t]he major lesson from our study is that economic freedom promotes peace. Consequently, the more a government erodes economic liberties, the greater the likelihood that a severe crisis or war will erupt” (p. 542).

Argues that foreign aid is propping up countries that are not economically free. Mr Vásquez also tests the notion that aid agencies target pro-growth policies. He finds that for the countries where economic freedom declines
or does not improve, foreign aid actually increases (19 of 20 cases). As well, in over one half of these countries GDP per capita declines. Makes reference to the general conclusions of *Economic Freedom of the World: 1997 Annual Report* regarding economic freedom and income and growth.

“The dynamic relationships estimated strongly suggest that economic freedom fosters economic growth. The impact of political freedoms on economic growth is much less clear. However, based on the evidence, it is plausible to say that political freedoms do not have to be postponed. Furthermore, the dynamic relationships estimated with the Kiviet method indicate that intensified democracy may result in faster growth and greater economic freedom. They also indicate that economic prosperity makes democratization easier. Our findings, therefore, are closer to Friedman's belief than to Lipset's: freedom is a key component in any attempt to improve economic and social well-being.” Uses ratings from *Economic Freedom of the World: 2001 Annual Report* as the main data source for institutional variables.

Makes reference to the general conclusions of *Economic Freedom of the World: 1975–1995* regarding economic freedom and income and growth and discusses conditions under which the rule of law can be maintained.

“Standard indicators of human capital endowment—like literacy, school enrollment ratios or years of schooling—suffer from a number of defects. They are crude. Mostly, they refer to input rather than output measures of human capital formation. Occasionally, they produce implausible effects. They are not robustly significant determinants of growth. Here, they are replaced by average intelligence. This variable consistently outperforms the other human capital indicators in spite of suffering from severe defects of its own. The immediate impact of institutional improvements, i.e., more government tolerance of private enterprise or economic freedom, on growth is in the same order of magnitude as intelligence effects are.” Summary ratings from *Economic Freedom of the World: 2000 Annual Report* provides a key institutional variable.

The paper develops a theoretical model describing the impact that economic and political freedoms might have upon economic growth, then estimates the relative impact of the two on growth in the world as a whole and for subsets of developing and developed nations. Summary ratings from *Economic Freedom of the World: 1975–1995* provide a key institutional variable.

“The main results are: given economic freedom, the rate of economic growth is independent of political freedom and the level of income; given the level of income, political freedom is independent of economic freedom and the growth rate. The analysis suggests the fundamental effects of economic freedom in fostering economic growth and a high level of income as the condition of a high degree of political freedom.” The article also uses principle component analysis to weight the results published in *Economic Freedom of the World*. Economic Freedom of the World: 1975–1995 and Freedom House’s Economic Freedom Indicators on political rights and civil liberties are the main data sources for institutional variables.
